1. Field of the Invention

The present invention relates to a technique for correcting a “rotation error”, or a “rotation angle”, in a data stream read from a medium and an image processing apparatus and an image processing method for correcting such an error in a digital signal. 2.

Description of the Related Art In an image processing apparatus such as a digital still camera, a scanner, a digital camera or the like, a period during which an image is photographed or read is a unit for dividing an image into multiple frames. In order to recognize the image in each frame, the image information (read data,

for example) is often converted into a digital signal. For example, the image information is converted into a luminance signal and a color-difference signal. When the image is read from a medium such as an optical disc or a magneto-optical disc, an error may occur in the read data. In particular, the read data may be

erased or an unnecessary image may be read. Such a phenomenon is called a “rotation error”. A technique for correcting a rotation error has been proposed. For example, Japanese Patent Application Laid-Open No. 09-058626 discusses a technique for setting a correct pulse position in a read data signal to be compared with an

expected pulse position
detected based on the
frame number or the
image read time and for
preventing an error in the

data. Japanese Patent

addition to the technique for correcting a rotation error, as a method for preventing an erroneous image caused by a rotation error. In the technique discussed in Japanese Patent Application Laid-Open No. 09-058626, even when the rotation error exists, the pulse position in the read data is set to be exactly the same as

the expected pulse position. Thus, a normal image can be obtained regardless of a data read position or a shift of the read data caused by the rotation error. However, when the pulse position in the read data is not correctly set, the image is “deflected” from an original image. This is because the desired pulse position in the read

data is not detected correctly. In the technique discussed in Japanese Patent Application Laid-Open No. 08-293964, when a frame number of

The Dodge Tool can be used to soften or blacken certain areas of an image. The Gradient tool

is a common way to create layered transitions in your artwork. The Healing Brush allows you to remove red eye or imperfections. The Magic Wand tool allows you to select a specific area of an image. The Pen Tool allows you to draw lines and shapes. The Sharpen tool can be used to improve the visibility of fine details in your

image. The Spot Healing Brush can be used to correct an area that doesn't completely blend into its surroundings. The Spot Healing Brush is particularly useful for working with portraits. For example, you can use the tool to remove distracting spots or blemishes from a person's face. The Stamp Tool is another type of

brush that you can use to create text. The tool allows you to place text anywhere in a document. You can edit the bevel and emboss effects in your images to add a sense of depth to them. Photoshop allows you to rotate, adjust, and mirror images, as well as create mirror images of your image. You can also manipulate text on your

image so that it's readable. Even after your image is done, you can easily make adjustments to its brightness, contrast, and colors.

Photoshop has a variety of tools that you can use to adjust the way that you work. The most basic tools include: Brushes are one of the most powerful tools in Photoshop. They allow you to paint on

your image using the various types of lines, colors, and textures provided by the program. The Healing Brush allows you to remove red eye, blemishes, and other unwanted imperfections from your image. The Curves tool allows you to create layers of different levels of contrast. The Hue/Saturation tool can be used to lighten or

darken certain colors in your image. The Adjustment Brush allows you to quickly apply color corrections, effects, and adjustments to your image without having to make changes to the pixels in your image. The Dodge and Burn tools allow you to "burn" out unwanted areas or even "dodge" unwanted objects out of an image.

The Puppet Warp tool lets you make subtle changes to an image's shape. The Pen tool allows you to draw lines and shapes on your image. The Eraser tool allows you to erase images or areas that are selected. The Liquify tool can be used to distort your image and create interesting visual
